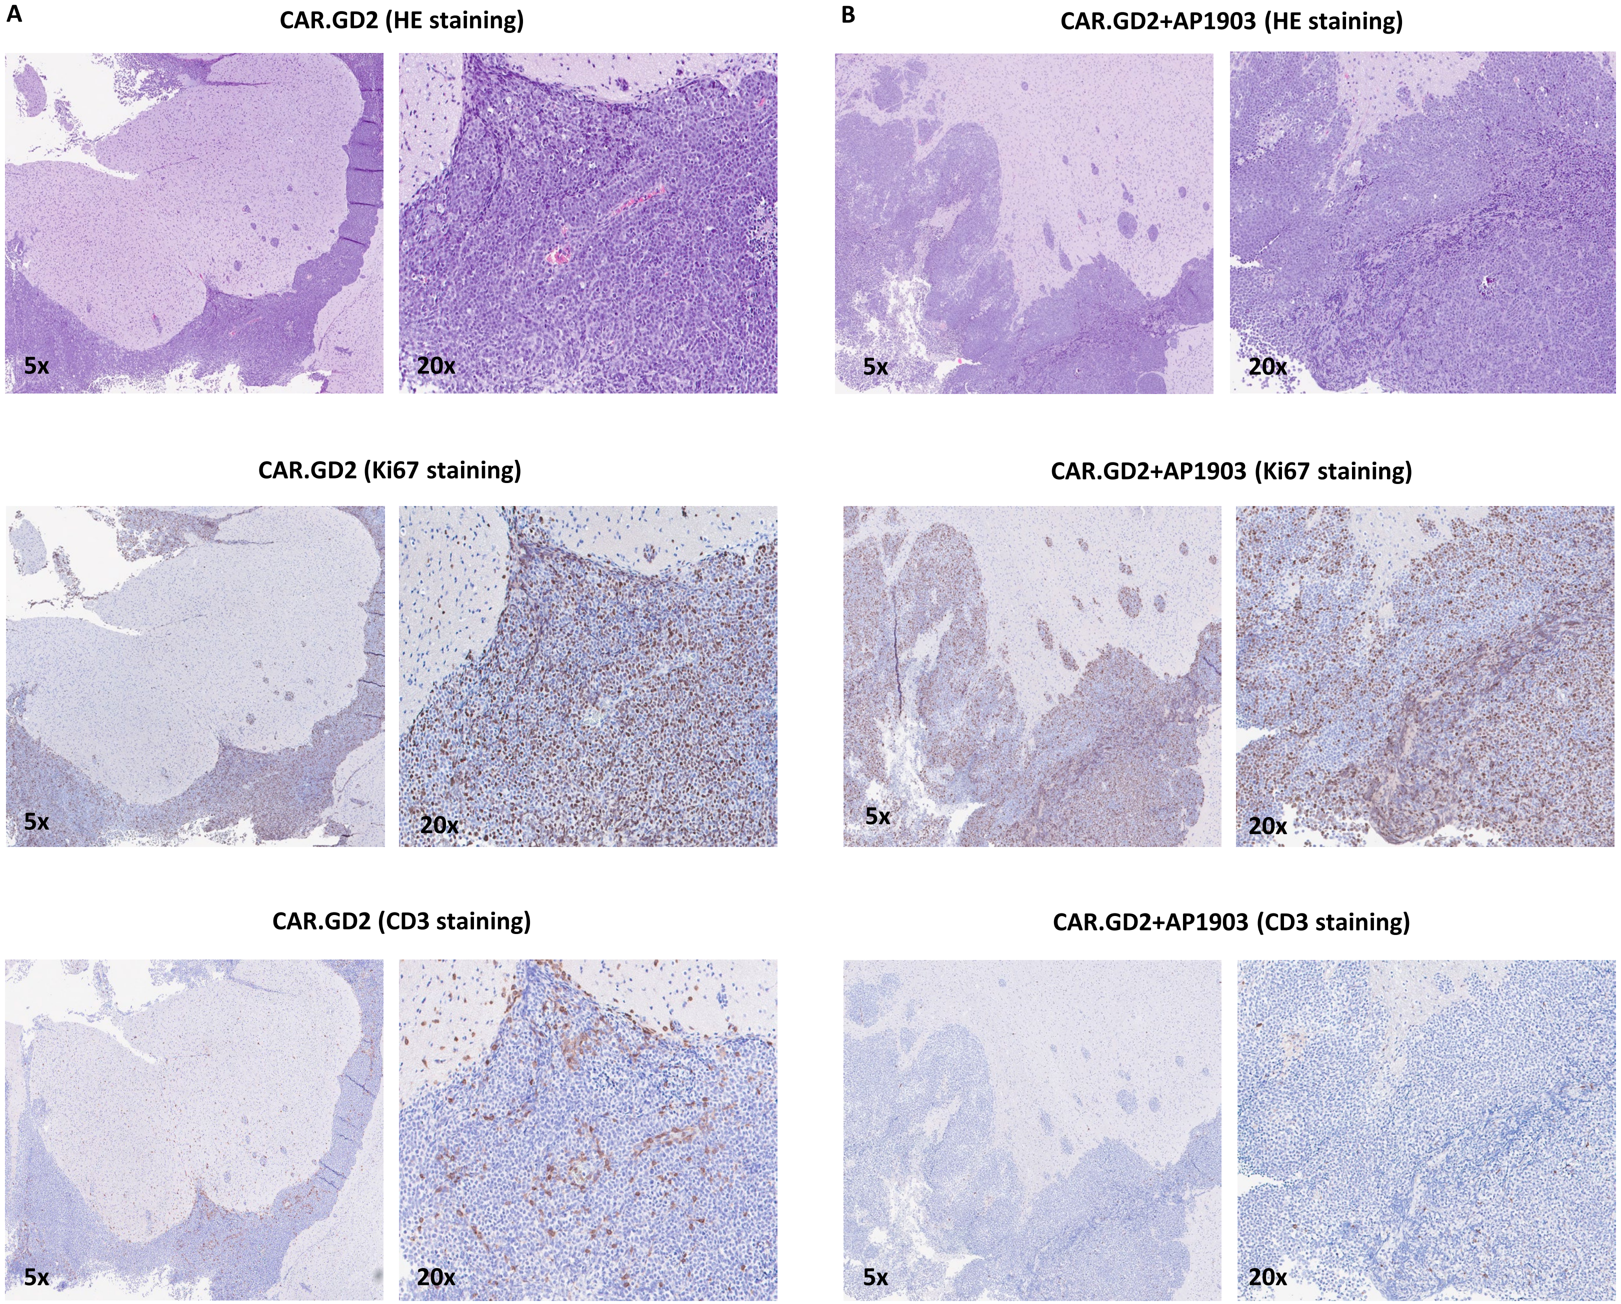
Supplemental Figure 16



Supplemental Figure 16. Evaluation of the efficacy of AP1903 CAR.GD2 T-cells infiltrating tumor in *in vivo* MB *xenograft mouse* model. NSG mice stereotaxically implanted with Med-411 FH mCherry/Luc. After tumor engraftment, twelve mice were infused with effector T-cells (six with CAR.GD2 T-cells and six with NT T-cells). When effector T-cells were detectable in peripheral blood, mice (three out of six mice treated with NT T-cells and three out of six mice treated with CAR.GD2 T-cells) were treated for three days (day 11/day 12/day 13 post T-cells infusion) with the AP1903 dimerizing agent activating iC9 suicide gene. Mice tissue brain were collected at the end of treatment (day 14). (**A-B**) Exemplificative hematoxylin-eosin staining (upper panels), Ki67 IHC (middle panels) and hCD3 IHC (lower panels) of MB tissues from the cerebellum of NSG mice receiving CAR.GD2 T-cells (**A**) (left panels) and mice receiving CAR.GD2 T-cells and AP1903 (**B**) (right panels). 5X and 20x magnification was used. IHC: immunohistochemistry.
