Supplemental Figure 15. Orthotopic PDX mouse model of human MED-411 FH mCherry/Luc cell line to evaluate anti-tumor activity of CAR.GD2 T-cells and the in vivo modulation of GD2 expression. (A-B) Flow-cytometry analysis of CD4⁺ and CD8⁺ cells in tumor bearing mice treated with NT-T cells **(A)** or CAR.GD2 T-cells **(B)**. Data are shown as average $\pm$ SD. **(C)** Flow-cytometry analysis of GD2 expression in MED411 mCherry FH at the pre-infusion time-point. **(D)** Flow-cytometry analysis of GD2 expression in tumor masses excised by five mice treated with NT T-cells and five mice treated with CAR.GD2 T-cells. Tumors from two mice (in red) treated with CAR.GD2 T-cells showed a decrease in GD2 percentage and GD2 MFI. **(E-G)** At the time of mice sacrifice, circulating CD3⁺ cells **(E)**, CAR⁺ T-cells **(F)** and tumor-infiltrating T cells **(G)** were also analyzed by FACS.
