

Supplemental Figure 17

Supplemental Figure 17. Evaluation of the NT T-cell infiltration in MB *xenograft mouse* model.

NSG mice stereotactically implanted with Med-411 FH mCherry/Luc. After tumor engraftment, six mice were infused with effector NT T-cells. When effector T-cells were detectable in peripheral blood, mice were treated for three days (day 11/day 12/day 13 post T-cells infusion) with the AP1903 dimerizing agent activating iC9 suicide gene. Mice tissue brain were collected at the end of treatment (day 14). **(A-B)** Exemplificative hematoxylin-eosin staining (upper panels), Ki67 IHC (middle panels) and hCD3 IHC (lower panels) of MB tissues from the cerebellum of a NSG mouse receiving NT T-cells (A, left panels) and in a mouse receiving NT T-cells and AP1903 (B, right panels). 5X and 20x magnification was used. IHC: immunohistochemistry.
