B

Supplemental Figure 8. Tazemetostat did not modulate GD2 expression in normal cells. Human Schwann cell, primary lung fibroblast and human T-cells were treated for 7 days with 1 or 10 μ M of Tazemetostat or DMSO as negative control. At the end of treatment (day+7), the percentage (**A**) and MFI (**B**) of GD2 on normal cells were analyzed by FACS. Data are expressed as column bar graph showing mean $\pm$ SD of three biological replicates. * $p < 0.05$, **($p < 0.01$, *** $p \leq 0.001$, **** $p \leq 0.0001$.
