

Supplemental Figure 9

**C**

**Supplemental Figure 9. Real-Time killing assay of CAR.GD2 T-cells vs DAOY-GFP cell line pre-treated with Tazemetostat.** DAOY-GFP, pre-treated with 1 and 10  $\mu$ M Tazemetostat or DMSO, used as a negative control, were co-cultured alone (**A**) and with NT or CAR.GD2 T-cells (**B**) at the E:T ratio of 1:1 ( $0.1 \times 10^6$  cell/well). The total Green Object Integrated intensity (GCU  $\times \mu\text{m}^2$  \Image), reported as “Green Area Confluence”, was analyzed from 0 up to 96 hours of co-culture. Green Area Confluence of DAOY-GFP cell line was normalized on T0. (**C**) Two-side ANOVA was used to compare overtime DMSO vehicle vs treated conditions with or without T cells. The experiment was performed with 2 different HDs. Values were extrapolated from 9 FOV (fold of view) and reported as mean  $\pm$  SEM. \* $p < 0.05$  (yellow), \*\* $p < 0.01$  (orange), \*\*\*\* $p < 0.0001$  (light red) and \*\*\*\* $p < 0.0001$  (violet).
