

Supplementary Figure 1. Substantial tumor growth suppression of HCC827 tumor by ACE2016.

Five millions of HCC827 cells were subcutaneously implanted into female SCID-Beige mice to evaluate the *in vivo* efficacy of ACE2016. When the tumor volume reached 50-100 mm³, the tumor-bearing mice were randomly assigned to groups. ACE2016 (1×10^7), $\gamma\delta 2$ T cells (1×10^7), and Vehicle were administered intravenously through the tail vein twice per week for two weeks. Bioluminescence of tumor burden in HCC827 cells subcutaneously implanted SCID-Beige mice was monitored weekly on Day 0, 7, 14, 21 and 28 post treatment of ACE2016, $\gamma\delta 2$ T cells, or Vehicle (n =5 per group).
