

(a)

(b)

Supplementary Figure 4. Role of TCR $\gamma\delta$ activation in ACE2016 cytotoxicity. Cytotoxicity of ACE2016 pretreated with TCR $\gamma\delta$ blocking antibody (1 $\mu\text{g}/\text{mL}$) against (a) HCC827 and (b) A549 cells at effector (E) to target (T) ratio of 2:1, 5:1 and 10:1 was analyzed by the luminescence-based viability assay CellTiter-Glo 2.0 after incubated for 4 hours. The percentage of cytotoxicity of each group was calculated by using the equation $[1 - (\text{ET-E})/\text{T}] \times 100$. Data were presented in mean value $\pm$ S.D. Statistical analysis was performed by *t*-test, *, $p < 0.05$; **, $p < 0.01$; ***, $p < 0.001$.
