

Figure S2

Figure S2. Biophysical properties of the ten CAR scFvs and their potential correlation with CAR-T tonic signaling indexes.

(a) Model building for the ten CAR scFvs using SWISS-MODEL.

(b) Net amino acid charges of the ten CAR scFvs at 0.15M Ionic strength and PH 7.5 calculated using the Protein-Sol webserver.

(c) Correlation between the net amino acid charge and the tonic signaling index in these CAR-T cells, assessed by the Pearson method.

(d) Energies of the ten CAR scFvs at 0.15M Ionic strength and PH 7.5 calculated using the Protein-Sol webserver. The energy is given in Joules per amino acid.

(e) Correlation between the energy and the tonic signaling index in these CAR-T cells, assessed by the Pearson method.
