

Figure S3

Figure S3. High tonic CAR-T cells cultured from high-salt medium exhibit reduced tonic signaling and less exhausted phenotype.

(a) Imaging analysis of CAR clustering of Jurkat T cells expressing ITAM mutant CSPG4 or GD2 CARs. Pink: CAR; green: CAR-IRES EGFP; blue: Hoechst. Scale bars, 5 μ m.

(b) Representative FACS plot of CD69, CD25, and ICOS expression of GD2 CAR-T cells cultured in either regular or high-salt medium.

(c-e) Jurkat T cells expressing indicated CAR were cultured in either regular or high-salt medium and CD69 expressions upon tumor antigen engagement were shown.

(f-h) Primary T cells expressing indicated CAR were cultured in either regular or high-salt medium and exhaustion markers, including PD-1, LAG-3, and TIM-3, normalized by GFP expression were shown.

Data are presented as means $\pm$ SEM; Comparisons were determined using two-way analysis of variance (c-e) and unpaired student's t-tests (f-h); * $P < 0.05$; ** $P < 0.01$; *** $P < 0.001$; ns not significant.
