

Supplemental Figure 12

Supplemental Figure 12. DAOY-GFP tumor bearing-mice treated with Tazemetostat to evaluate GD2

upregulation *in vivo*. (A) Illustration of the experimental design of DAOY-GFP cells stereotactically implanted into the cerebellum of 28 NSG mice (Figure created using Biorender - <https://biorender.com>). At the time of tumor engraftment (day 3), Tazemetostat was administered through oral gavage BID for ten days. (B-C) Tumor mass explanted from euthanized mice (three mice for each cohort) were analyzed for the percentage of GD2+ cells (B) and GD2 MFI (C). (D). Time course of *in vivo* bioluminescence imaging of NSG mice pre-treated with Tazemetostat (upper panel) and subsequently infused with effector cells after T-cells infusion (bottom panel). (E-F) Time course of bioluminescence on each single mouse (E) and in average for each mouse cohort (F). (G) Tumor bioluminescence at the early time point of 6 days after effector T cell infusion (day +19), comparing untreated and treated group. T-Test was used as statistic analysis. * $p < 0.05$, ** $p < 0.01$, *** $p < 0.001$. BID: bis in die.
