B

Supplemental Figure 13. Evaluation of GD2 expression on DAOY cells pre and post treatment with Tazemetostat. 0.1×10^6 DAOY-GFP cells were seeded in 6-well plate and treated for 7 days with 1 or 10 μM of Tazemetostat or DMSO as negative control. At the end of treatment, cells were washed in PBS 1X and seeded at the starting density. GD2 expression was evaluated after 7 days using flow cytometry. Percentage of GD2+ cells (**A**) and GD2 MFI (**B**) on DAOY-GFP cell line pre-treatment, at the end of treatment (T7) and after an additional week of treatment washout (T14). Data are expressed as column bar graph showing mean $\pm$ SD of three replicates. Two-way Anova was used as multi comparison test. * $p < 0.05$, ** $p < 0.01$.
